Jared Kahn

kahn.j@northeastern.edu | jared-kahn | kahnj | Boston, MA

Education

Northeastern University, Khoury College of Computer Sciences — Boston, MA
B.S. in Computer Science and Business Administration — Sep 2016 - May 2021

Technical Expertise

Languages: Java, TypeScript, JavaScript, Python
Web Frameworks: React, Next, Django, Spring, LWR, LWC
Visualization Tools: D3.js, Grafana, Power BI, Tableau
Databases: PostgreSQL, MongoDB, Neo4j
CSS Frameworks: Tailwind, Bulma, SLDS, Bootstrap
ML/NLP Tools: scikit-learn, NLTK, spaCy, Azure AI Search

Experience

Salesforce — Boston, MA
Senior Software Engineer — Apr 2022 - Present

Agentic Developer Experience

- Leading development of the Salesforce Agentic Developer Experience, architecting next-generation Agent-as-a-Service harnesses (Docker, NodeJS, Java), SDKs, and developer tooling across the Salesforce Platform.
- Designing core layers of MCP Servers, Agent Skills, and CLI tooling enabling autonomous agents to interface with backend APIs, configure UI layouts, and execute real-time application creation and delivery.
- Building automated evaluation frameworks and AI workflows to benchmark agent interactions, driving reliable and consistent multi-step task execution.

Core Web Platform

- Full-stack contributions in design and implementation of features (Spring, Java, JavaScript) for Salesforce's latest web framework and design systems, enabling creation, editing, and delivery of 100,000+ enterprise e-commerce stores, landing pages, and other global-scale customer sites.
- Recognized with org-wide performance awards for architecting a custom Java-based JavaScript bundler that reduced site bundle sizes and build time both by 90% in addition to delivering sub-second page loads via server-side rendering.
- Enhanced platform reliability to 99.99% for 250k+ requests/minute by implementing distributed logging and telemetry monitoring (Argus, Grafana, Splunk) across 50+ critical services.

Modern UI Framework Support

- Key contributions for multi-framework support (React, Vue, Angular) from concept to general availability across Salessforce platforms; presented architecture to customers at TDX, Salesforce's largest developer conference.
- Designed and authored shadcn-style React component library, delivering secure authentication flows, automated session management, and high-performance global search.

Accenture — Needham, MA
Software Engineer — Jan 2020 - Mar 2022

- Developed an data processing pipeline and interface (Django, Azure) to enable data-driven analysis of software procurement. The platform tracked and provided visibility into 10,000+ software vendors and $10+ billion in IT spend by Fortune 500 companies.
- Incorporated a specialized document search engine (Azure AI Search), alongside machine learning (scikit- learn) and natural language processing functionality (NLTK, spaCy) to increase the efficiency of software contract assessments and research.

MFS Investment Management — Boston, MA
Data Services Co-op — Jan - Aug 2019

- Acted as the primary developer for the Data Services and Marketing Automation teams, engineering automated data pipelines (SQL, Informatica) to streamline critical financial workflows by extracting data from multiple sources and formats to then be transformed and stored in relational databases.

Meditech — Foxboro, MA
Software Programmer Co-op — Jan - Aug 2018

- Developed both backend and user interface functionality for an extension to Meditech's electronic health record application to improve the organization and access of patients' medical documents.

Projects

Automated Quoting System (Django, CRM, Vercel) Jul 2023

- 6-month part-time paid consulting project to assess and streamline the sales quote generation process. Architected and built tools to automate and standardize workflows, including a user-friendly quote generation website (Django, CRM, Vercel) that integrated with CRM via OAuth and generated quote documents for the sales team to use.

MOSS Algorithm Plagiarism Detector (TypeScript, React) Dec 2020

- Researched and implemented mode oriented stochastic search (MOSS) algorithm for identifying examples of plagiarism within students' code. Designed a React-based web application for administrators to review and confirm detected instances of plagiarism.

Interactive Visualization of Bicycle Safety in Boston (d3.js) Dec 2019

- Constructed an interactive application for displaying relative safety between various types of bike lanes using a JavaScript visualization library (d3.js). Aggregated bicycle accident, vehicle traffic and bike lane network data for the city of Boston.

Racing Game with Autonomous Opponents (C#, Unity) Apr 2021

- With Unity's game engine, developed a kart racing game that included multiple game types with both manually and autonomously controlled karts. Autonomous kart movements were based on either an A* search algorithm or a trained reinforcement algorithm, depending on the game type.

Predicting the Severity of Car Accidents (Python) Dec 2020

- Predicted the severity of traffic accidents based on several factors including type of street, weather, time of day, etc. Implemented and analyzed the performance of classification techniques including Random Forest, Logistic Regression, SVM, AdaBoost, Feature Selection and a Feed-Forward Neural Network.
